Prepared for: Gaming Meta Guide RAG Pipeline

Retrieved at: 2026-08-04

Riot's Teamfight Tactics developer documentation explains how official TFT data is exposed through APIs and Data Dragon. Data Dragon contains static TFT data such as champions, items, traits, augments, tacticians, arenas, and assets. Static data is useful for a Gaming Meta Guide because it gives canonical names and IDs for champions and items.

Riot also describes approved and unapproved app behavior. School projects and training tools are acceptable examples when they help players learn. Apps should increase decision diversity, not remove decisions or dictate one exact play every moment. Static pre-game recommendations can be acceptable, while real-time prescriptions based on the player's current game state can violate game-integrity rules.

For this RAG project, item-build answers should be framed as educational recommendations based on patch notes, meta statistics, and guide context. The assistant should avoid claiming that a build is guaranteed to win, and should mention that meta data changes after patches.
