TFT item mechanics determine how build recommendations should be interpreted. Champions can hold up to three items. If a champion is sold, the equipped items are returned. When units combine and would exceed the item limit, extra items are dropped back to the player.

Item stacking depends on the item. Some effects stack additively, but some items or unique effects do not stack with themselves. A good build guide should recommend a core item package and explain alternatives instead of blindly stacking the same item.

Item recommendations should account for the champion's role. Attack damage carries usually value attack damage, attack speed, critical strike, armor penetration, or sustain. Magic damage carries usually value ability power, mana generation, magic penetration, and critical spell damage. Frontline tanks usually value health, armor, magic resistance, shields, and healing.
