A Gaming Meta Guide should answer champion build questions by combining several evidence types: official patch notes, item mechanics, statistics from recent ranked games, and human guide reasoning. Statistics can show which items are frequently successful on a champion, while guides explain why those items work.

The assistant should identify the requested champion, retrieve the latest relevant champion build chunk, and return three layers of advice: core items, replacement items, and when to pivot. If the query is vague, such as "tuong nay len do nao", the assistant should ask for the champion name or use the champion mentioned in conversation memory.

Meta recommendations are patch-sensitive. A build that is strong in one patch may become weaker after champion, trait, augment, or item balance changes. Answers should include the patch or source context when available.
